The primary objectives that the founding members of the Italian Society for Neurofeedback and QEEG (SINQ) have set themselves since the preliminary meetings are the dissemination of Quantitative Electroencephalography (qEEG) and Neurofeedback.

One of the main objectives of SINQ is the constant scientific updating, its promotion and above all its dissemination in Italy. Therefore, an essential part of its mission is the organization and provision of courses, workshops, congresses and group activities aimed at fostering interaction between members.

Moreover, the society aims to cope over time the fragmentation that currently characterizes Neurofeedback training in Italy, trying to spread professional ethics as well as good practice in terms of both learning and the clinical application of tools that are as fascinating as complex to master.

To achieve this goal, SINQ has long-established contacts with the most important international societies of qEEG and Neurofeedback certification societies to introduce them in Italy, in the strong belief that this is the only way to guarantee a rigorous control on the educational training, updating and, above all, support the therapeutic efficacy among the providers.

The purposes of SINQ are both cultural and scientific. For this reason, it is endorsed by a Scientific Board with some of the most important Italian experts in the scientific field.

SINQ aims to establish a Society in which members will collaborate and support each other in research projects and daily clinical practice. The Society wants to provide a wide range of quality services to regularly registered members, promote meetings/conferences/congresses and disseminate the application of Neurofeedback and qEEG updated to the latest evidence from the scientific literature.
